

FLAT BRONZE - SECTIONED CUTTED BARS

The following is a list of measures of flat bars at our warehouse or realizable and available shortly.
The weights given refer to the tin bronzes (specific gravity 8.9). For other alloys please use the calculator weights in this section "services" of the site.
We recall that the weights are to be understood as "theoretical."

Besides being able to provide the bars in continuous casting to the desired extent, we can cut the plates of different thickness to the width and length desired by the customer in order to satisfy even the most difficult requests. Again, these plates are still cast a continuous casting and thus the quality of the material remains guaranteed.
